IUPAC Naming and Writing Formulas

Balanced Chemical Equations

IUPAC Nomenclature

(not covered in textbook)

Chemical Nomenclature (Naming)

It is important to have *one* system to name chemical compounds. Why?

- Scientists can communicate with each other and the public, even in different languages
- Every compound has a unique name
- Information/records are accurate and consistent

IUPAC (International Union of Pure and Applied Chemistry) came up with a naming scheme that is used around the world.

Ionic Compound Nomenclature

(not covered in textbook)

Intro to Ionic Compound Nomenclature

Cation comes first; anion comes second.

Names of ionic compounds tell you *which ions* are in the compound.

e.g. "sodium chloride" has Na^+ and Cl^- ions.

e.g. "titanium(IV) dichromate" has Ti^{4+} and $\text{Cr}_2\text{O}_7^{2-}$ ions.

Chemical formulae tell you *how many of each ion* are in the compound, using subscripts.

e.g. " CaCl_2 " has 1 Ca^{2+} ion and 2 Cl^- ions.

e.g. " $\text{Mn}(\text{OH})_2$ " has 1 Mn^{4+} ion and 2 OH^- ions.

Naming Ionic Compounds

1. Write the **cation**, first.

For metals that can only form one ion (monovalent metals), do not write the ion charge.

For multivalent metals, determine the ion charge through **charge balancing**. Then, put the ion charge in **Roman numerals**, in brackets.

If the cation is polyatomic, write it exactly the way it is written in the table.

2. Write the anion with **"-ide" ending** (unless it is polyatomic).

Naming Ionic Compounds

1. Write the **cation**, first.

For metals that can only form one ion (monovalent metals), do not write the ion charge.

For multivalent metals, determine the ion charge through **charge balancing**. Then, put the ion charge in **Roman numerals**, in brackets.

If the cation is polyatomic, write it exactly the way it is written in the table.

2. Write the anion with **"-ide" ending** (unless it is polyatomic).

Naming Ionic Compounds

1. Write the ***cation, first.***
2. Write the ***anion with "-ide" ending.***

Chemical Formula	Periodic Table	Name		
NaCl	<table border="1"><tr><td>11 + Na Sodium 23.0</td><td>17 - Cl Chlorine 35.5</td></tr></table>	11 + Na Sodium 23.0	17 - Cl Chlorine 35.5	
11 + Na Sodium 23.0	17 - Cl Chlorine 35.5			
MgBr₂	<table border="1"><tr><td>12 2+ Mg Magnesium 24.3</td><td>35 - Br Bromine 79.9</td></tr></table>	12 2+ Mg Magnesium 24.3	35 - Br Bromine 79.9	
12 2+ Mg Magnesium 24.3	35 - Br Bromine 79.9			

Your Turn!

Name the following ionic compounds with monovalent metals.

Naming Ionic Compounds

1. Write the ***cation, first.***
2. Write the ***anion with "-ide" ending.***

Oh no! Chromium is multivalent.
Charge balancing is used to
find the charge of a
multivalent metal ion.

Chemical Formula	Periodic Table	Name																
Cr_2O_3	<table border="1"><tr><td>24</td><td>3+</td><td>8</td><td>2-</td></tr><tr><td>Cr</td><td>2+</td><td>O</td><td></td></tr><tr><td>Chromium</td><td></td><td>Oxygen</td><td></td></tr><tr><td>52.0</td><td></td><td>16.0</td><td></td></tr></table>	24	3+	8	2-	Cr	2+	O		Chromium		Oxygen		52.0		16.0		???
24	3+	8	2-															
Cr	2+	O																
Chromium		Oxygen																
52.0		16.0																
CrO		???																

Naming Ionic Compounds

1. Write the cation, first.

For metals that can only form one ion (monovalent metals), do not write the ion charge.

For multivalent metals, determine the ion charge through ***charge balancing***. Then, put the ion charge in ***Roman numerals***, in brackets.

2. Write the anion with “-ide” ending.

Charge Balancing (to find the charge of a **multivalent** metal ion)

- 1) Write out all the ions you have. Leave the charge blank on the multivalent metal.
- 2) Rule: *The total number of **positive** charges in an ionic compound must equal the total number of **negative** charges. Determine the charge on the metal ion.*
- 3) Write the compound name. Specify the ion charge on the multivalent metal using brackets and Roman numerals.

Charge Balancing Part 1: Determining Charges of Multivalent Metals

24 3+
Cr 2+
 Chromium
 52.0

8 2-
O

O
 Oxygen
 16.0

CrO:	
1) Write out all the ions you have. Leave the charge blank on the multivalent metal.	<div style="display: flex; justify-content: space-around; align-items: center;"> Cr? O²⁻ </div> <div style="background-color: yellow; padding: 5px; margin-top: 10px;"> We know there is 1 chromium ion and 1 oxygen ion from the subscripts in the formula. </div>
2) <i>The total number of positive charges in an ionic compound must equal the total number of negative charges.</i> Determine the charge on the metal ion.	Total: 2 negative charges. Must have 2 positive to balance the charges. Divide by # of chromium ions (1). Therefore, each Cr ion must have a 2+ charge.
3) Write the compound name. Specify the ion charge on the multivalent metal using brackets and Roman numerals.	chromium(II) oxide

Your Turn!

Name the following ionic compounds with multivalent metals.

Your Turn!

Name the following ionic compounds. Make sure you do charge balancing for ionic compounds with multivalent metals only.

- 1) Who wants to take a **Na₃P**?
- 2) Better **FeS** up.
- 3) Is your name **Be₃N₂**?
- 4) What about **AmI₆**?
- 5) "Vegetable" in Chinese is **CaI₂**.

Naming Ionic Compounds

1. Write the cation, first.

For metals that can only form one ion (monovalent metals), do not write the ion charge.

For multivalent metals, determine the ion charge through charge balancing. Then, put the ion charge in Roman numerals, in brackets.

If the cation is polyatomic, write it exactly the way it is written in the table.

2. Write the anion with “-ide” ending (*unless it is polyatomic.*)

Polyatomic Ions

Note: Become familiar with these names so you can recognize them quickly in the future.

NAMES, FORMULAE AND CHARGES OF SOME POLYATOMIC IONS

Positive Ions	Negative Ions
NH_4^+ Ammonium	CH_3COO^- Acetate
	CO_3^{2-} Carbonate
	ClO_3^- Chlorate
	ClO_2^- Chlorite
	CrO_4^{2-} Chromate
	CN^- Cyanide
	$\text{Cr}_2\text{O}_7^{2-}$ Dichromate
	HCO_3^- Hydrogen carbonate, bicarbonate
	HSO_4^- Hydrogen sulfate, bisulfate
	HS^- Hydrogen sulfide, bisulfide

Positive Ions	Negative Ions
	HSO_3^- Hydrogen sulfite, bisulfite
	OH^- Hydroxide
	ClO^- Hypochlorite
	NO_3^- Nitrate
	NO_2^- Nitrite
	ClO_4^- Perchlorate
	MnO_4^- Permanganate
	PO_4^{3-} Phosphate
	PO_3^{3-} Phosphite
	SO_4^{2-} Sulfate
	SO_3^{2-} Sulfite

Naming with Polyatomic Ions: Examples

Must have 6 positive to balance the charges. Divide by # of titanium ions (2). Therefore, each Ti ion must have a 3+ charge.</p>
<p>3) Write the compound name. Specify the ion charge on the multivalent metal using brackets and Roman numerals. Spell the polyatomic ion exactly as it is spelled in the reference sheet.</p>	<h2>titanium(III) chromate</h2>

Writing Formulas of Ionic Compounds

(not covered in textbook)

Intro to Ionic Compound Nomenclature

Names of ionic compounds tell you *which ions* are in the compound. The cation comes first; the anion comes second.

To write a chemical formula of an ionic compound, you must find out how many of each ion is involved, through **charge balancing**.

Rule: The total number of positive charges in an ionic compound must equal the total number of negative charges.

Writing Formulas of Ionic Compounds (v1)

1. Write down each ion with its charge.
2. Add more of the ions to balance the charges: the total number of positive and negative charges must be equal.
3. Write your formula with subscripts.

To indicate more than one of a polyatomic ion, use brackets with the subscript outside.

Writing Chemical Formulas: Examples (v1)

20 2+

Ca

Calcium

40.1

15 3-

P

Phosphorus

31.0

calcium phosphide

1) Write down each ion with its charge.

2) Add more of the ions to balance the charges: the total number of positive and negative charges must be equal.

3) Write your formula with subscripts.

Writing Chemical Formulas: Examples (v1)

24	3+
Cr	2+
Chromium	
52.0	

HSO_3^- Hydrogen sulf

OH^- Hydroxide

ClO^- Hypochlorite

chromium(II) hydroxide

1) Write down each ion with its charge.

2) Add more of the ions to balance the charges: the total number of positive and negative charges must be equal.

3) Write your formula with subscripts.

Writing Formulas of Ionic Compounds (v2)

1. Write down each ion with its charge.
2. Write the chemical formula by writing the cation first and the anion second. Then, "criss-cross" the charges to become the subscripts.
3. Reduce the subscripts if both divisible by the same number.

Writing Chemical Formulas: Examples (v2)

20 2+

Ca

Calcium

40.1

15 3-

P

Phosphorus

31.0

calcium phosphide

1) Write down each ion with its charge.

2) Write the chemical formula by writing the cation first and the anion second. Then, "criss-cross" the charges to become the subscripts.

3) Reduce the subscripts if both divisible by the same number.

2 and 3 do not have a common factor. Therefore, **Ca₃P₂** is our final answer.

Writing Chemical Formulas: Examples (v2)

24	3+
Cr	2+
Chromium	
52.0	

HSO_3^- Hydrogen sulf

OH^- Hydroxide

ClO^- Hypochlorite

chromium(II) hydroxide

1) Write down each ion with its charge.

2) Write the chemical formula by writing the cation first and the anion second. Then, "criss-cross" the charges to become the subscripts.

3) Reduce the subscripts if both divisible by the same number.

1 and 2 do not have a common factor. Therefore, $\text{Cr}(\text{OH})_2$ is our final answer.

Writing Chemical Formulas: Examples (v2)

12 2+

Mg

Magnesium

24.3

CH₃COO⁻ Acetate

CO₃²⁻ Carbonate

ClO₃⁻ Chlorate

magnesium carbonate

1) Write down each ion with its charge.

2) Write the chemical formula by writing the cation first and the anion second. Then, "criss-cross" the charges to become the subscripts.

3) Reduce the subscripts if both divisible by the same number.

2 and 2 are both divisible by 2. Rewrite formula as **MgCO₃**.

Writing Chemical Formulas: Examples (v2)

25 2+
Mn 3+
Manganese 4+
54.9

PO_3^{3-} Phosphite

SO_4^{2-} Sulfate

SO_3^{2-} Sulfite

manganese(IV) sulfate

1) Write down each ion with its charge.

2) Write the chemical formula by writing the cation first and the anion second. Then, "criss-cross" the charges to become the subscripts.

3) Reduce the subscripts if both divisible by the same number.

4 and 2 are both divisible by 2. Rewrite formula as $\text{Mn}(\text{SO}_4)_2$.

Naming and Writing Formulas: Covalent Compounds

(not covered in textbook)

Naming Binary Covalent Compounds

Binary covalent compound: a covalent compound containing only two elements

Names and formulas of covalent compounds *both* tell you:

- Which elements?
- How many atoms of each element?

Example: **dichlorine monoxide** is **Cl₂O**

Prefixes Reference

PREFIXES

1	mono
2	di
3	tri
4	tetra
5	penta
6	hexa
7	hepta
8	octa
9	nona
10	deca

Arabic Numeral	Prefix	Arabic Numeral	Prefix
1	mono	6	hexa
2	di	7	hepta
3	tri	8	octa
4	tetra	9	nona
5	penta	10	deca

Naming Binary Covalent Compounds

1. Write the first element.
2. Write the second element with **"-ide" ending**.
3. Add **prefixes** to show how many of each element there is.
 - Do not add **"mono-"** to first element.
 - If adding "mono-" to "-oxide", write **"monoxide"** instead.

e.g. O_2F_2

di oxygen di fluoride

e.g. PF_3

phosphorus tri fluoride

e.g. N_2O

di nitrogen mon oxide

Note: All compound names (covalent *and* ionic) are lowercase.

More Practice: Binary Covalent Compounds

Chemical Formula	Compound Name
S₂O₅	
Cl₃O₇	
CBr₂	
NO	
CCl₄	
P₂S₆	

Naming Binary Covalent Compounds

Covalent compounds with special names (must memorize):

NH_3 = ammonia

H_2O = water

CH_4 = methane

NH_4^+ (ammonium ion)
and NH_3 (ammonia)
are ***not the same!!!***

Chemical Formulas of Binary Covalent Compounds

1. Identify the elements involved. Write their **symbols**.
2. Use the **prefixes** to determine the number of each element in the compound. Write as **subscripts**.

e.g. tetraphosphorus pentoxide

e.g. nitrogen triiodide

e.g. selenium difluoride

More Practice: Binary Covalent Compounds

Chemical Formula	Compound Name
	nitrogen trioxide
	triphosphorus tetraoxide
	iodine pentafluoride
	tricarbon disulfide
	boron trifluoride
	xenon hexafluoride
